Steps to GitHub success

At the beginning of class:
- Pull from the upstream online GitHub repository with
  - **git pull upstream master**

At the end of class:
- Save your changes the Git way with:
  - **git add .**
    - (the **.** adds all files that have been changed. You can also write **git add** filename with an individual file)
  - **git commit -m "Write a message here explaining the changes"**
- Push your changes to your online repository with
  - **git push origin master**

Remember, to do any work in a Git repository, you must first navigate to that repository in Terminal using **cd**.

If you forget to **add**, **commit** and **push** at the end of class, do that at the beginning of next class before you **pull**!
